

Priyamwada Pandey

Product Designer with experience in designing AI-powered products across startup and enterprise teams, agent builders, conversational assistants, developer tooling and internal products. I've been an early design hire at a bootstrapped startup where I owned design end-to-end and built both the design system and team process from scratch. I work where the design needs me, whether that is on a design canvas or in a terminal.

EXPERIENCE

Conversational AI Design Intern @ Rocket Mortgage

DETROIT, MI * MAY 2025 - AUG 2025

- Redesigned the post-offer onboarding experience inside Rocket Assist from a generic, text-based assistant into a personalized, context-driven system by researching available APIs to ground each interaction in the client's actual loan stage and home details.
- Introduced three interaction patterns that entered roadmap discussions: a task carousel for guided next-step completion, an in-chat document component with download capability and a human handoff flow with specialist availability and callback scheduling.
- Defined usability success criteria and wrote the discussion guide used by the research team to validate concepts with Rocket Mortgage clients. 92% of clients found the experience more helpful and trustworthy, directly attributing it to how personalized it felt.
- Presented design proposals across ongoing stakeholder check-ins and a final handover, and defined each feature into its technical dependencies, APIs, cross-team knowledge requirements and engineering scope, resulting in roadmap-ready scoping.

Product Designer @ Tars Technologies

BENGALURU, INDIA * SEP 2021 - JUL 2024

- Drove 41% product adoption within 3 months of beta launch by owning research and product design for the Asimov dashboard and Slack app, enabling teams to access AI-driven assistance inside existing workflows.
- Designed and shipped an internal Debug Mode for Customer Success teams that surfaced conversation flow errors, reducing troubleshooting time by 70%, validated through direct customer success team feedback.
- Built the design system from the ground up as one of the first design hires, shipping component libraries for the Asimov dashboard and website that scaled across the product as the team grew.
- Led end-to-end design execution across 10 dashboard sections and 15 website pages as part of Tars' first major product rebrand, establishing component systems and developer handoff processes that kept design and implementation in sync at scale.
